

CVC Paging Announces Completed Construction of Redundant Satellite Up-Link Facility

CVC Paging is pleased to announce the completed construction of our new paging up-link facility located at our corporate offices in Rutland, VT. The up-link facility is 100% redundant and features Andrew 4.6 and 3.7 meter earth station antennas. The implementation of our redundant up-link facility provides satellite redundancy, increased network efficiency and enhanced command and control capabilities.

CVC Paging is proud to be the only paging company in the Northeast to be up-linking our paging data to two separate satellites for complete redundancy. In fact, many of the large national paging companies have not achieved this level of redundancy. The new up-link facility is also providing increased network efficiency. Our average through-put time (the time it takes from when you send a page to when it is actually received) has been reduced dramatically. Our through-put time is now at a level that is unheard of in the paging industry.

As the preferred paging provider for hospitals, utility companies, health care facilities, corporations, public safety organizations, municipalities, small businesses and others, we understand the importance of quality service and network integrity. CVC Paging is committed to bringing the absolute best in quality service and system integrity.
